

CONTRIBUTION TO KNOWLEDGE OF ENORMOUS EARTH'S MAGNETIC FIELD (EMF) INTENSITIES IN ETIOPATHOGENESIS OF CARDIOVASCULAR DISEASES (CVD)

Eng. Nikola Trifunovic, Md.ph. Dragoslav Nikolic – research partners

This paper's aim is contribution to CVD etiopathogenesis occurred under the influence of enormous EMF intensities. It has been studied how changed values of EMF cause diseases. Effect of enormous EMF zones has been revealed, and the diseased was moved away from the influence of these enormous zones. Synthesis of two data groups has been made. Processing the first data group correlation between present enormous EMF zones and body region overtaken by the disease was determined. The second data group are theoretical explanations of unclearances found in literature concerning CVD from the EMF knowledge aspect. Coincidence between practical measuring results and theoretical explanations of many unclearances has been determined.

It was concluded that enormous EMF are the main cause of many CVD and that moving the diseased away from the enormous EMF is great help to the patient and his doctor in treatment.
